

Spot Image Analysis V5R8

info.txt in the images directory (example), new for R7 and R8 parameters in red

gridy 6

gridx 8

refx 1 (use knowledge of reference spots in X)

ngroups 16

group 1 2 3 4 5 6 7 8 1 2 3 4 5 6 7 8 1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 9 10 11 12 13 14 15 16 9 10 11 12 13 14 15 16

groupnames GRP1 GRP2 GRP3 GRP4 GRP5 GRP6 GRP7 GRP8 GRP9 GRP10 GRP11 GRP12 GRP13 GRP14 GRP15 GRP16

skipoints 1

normpoints 3 (normalization of plots is done to the average of normpoints following skipoints; default = 1)

trendpoints 5 (Removal of linear trend if trendpoints \geq 2. Trendpoints after skipoints are used to estimate the trend.)

basepoints 0 (use as base points for curve analysis. If 0 – finds automatically)

plotgrp 2 3 4 5 6 7 8 9 10 11 12 13 14 15

~~date DD-MON-YYYY (removed)~~

Root

Algorithm at a Glance - 1

For each directory of the directory tree under Root:

Create subdirectory for results of the current analysis run

First pass through all files – spot finding {

Read image

Adjust contrast to full range

Remove background

Remap with gamma

Find adaptive threshold as quantile of histogram and make spot mask

Modify spot masks:

fill by majority, remove small components, fill holes,

for large components repeatedly raise threshold for possible acceptance,

smooth spot contours

Filter spots by shape

Find grid from projections of intensity image masked by spots and remapped with gamma for the second time

Analyze by spots and leave only if they satisfy given limits: gtolerance, asnominalim, cocentrlim, solidlim

Write results table

}

Find the best image and extract its results

Find union of all spots in all images (with shifts)

for best image and each current image find the best pair of spots to determine shift, record shifts for the second pass

add current mask with shift to accumulator

Find final mask where $\geq 80\%$ of existing masks agree

Find grid from projections of accumulated masks

Renumber spots by rows and columns

Form label markers: reconstruct labels for spots and form labels for rings

Algorithm at a Glance - 2

Second pass through all files – spot measurement {

Read image

Retrieve shifts and shift the label images for spots and rings

Measure:

integrated intensity in spots, integrated intensity above background in spots,

average intensity above background in spots, average intensity in rings (negative values are forced to zero)

}

Write results for spots

Average by groups, write and plot normalized (to the first non-skipped point) results

Analyze cycle curves for individual spots by groups (skipping a given number of points)

Align by regression analysis all curves from different spots within one group

Remove linear trend using trendpoints points for the estimate

Find by ANOVA the first run of non-significantly-different points

For these points find average, SD, and threshold level = average + SD * times_sd

Find cycle threshold where threshold level intersects the curve using polynomial approximation (power=4)

Write threshold results

Automate PowerPoint to create a presentation with figures and data

Original

Contrasted

Background

After Background Removal and Second Contrasting

Adaptive Threshold as Quantile of Histogram

Raw Spot Mask after Thresholding

Mask after Removing Small Components

Mask after Filling Holes

Mask after Raising Threshold in Large Components

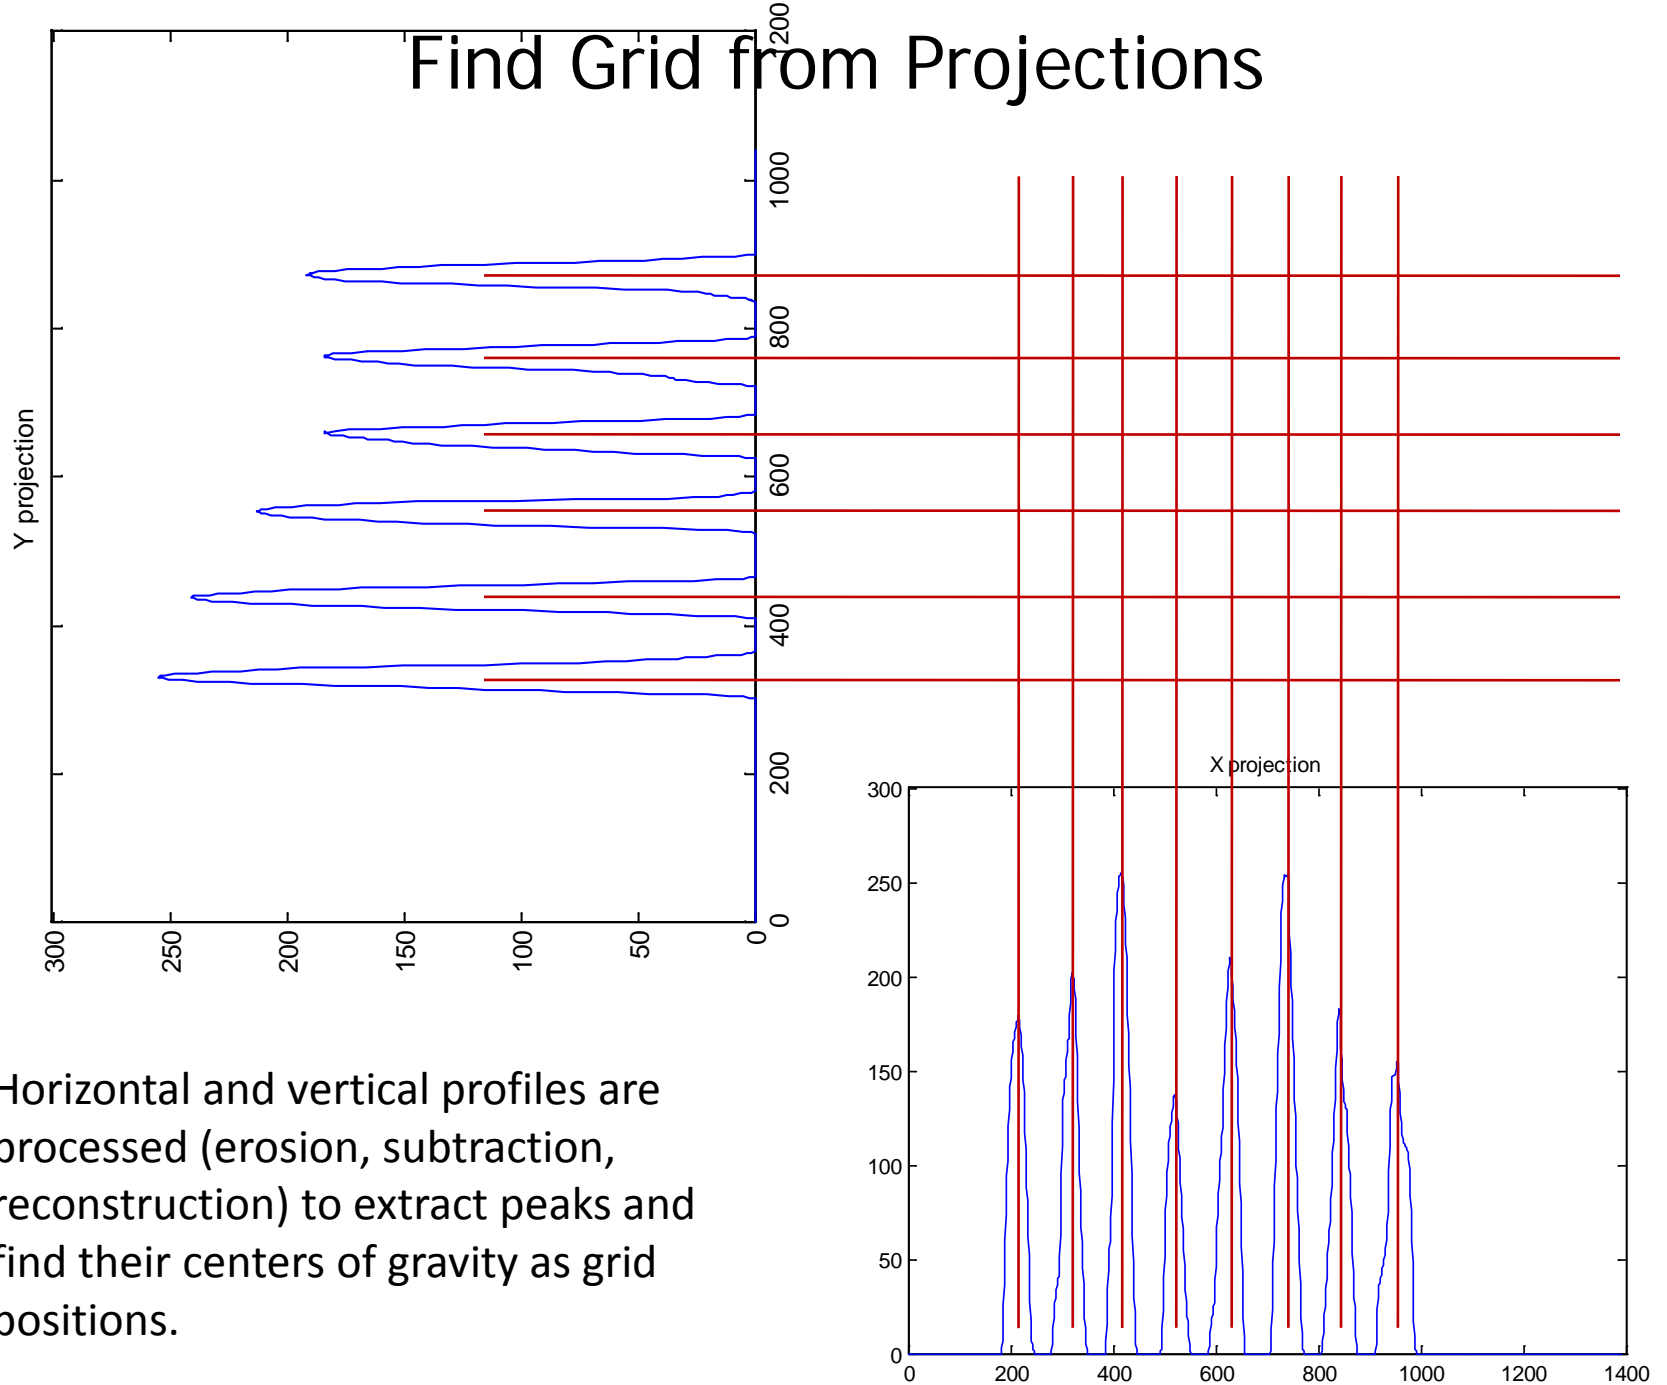

Mask After Smoothing Spot Outlines

Mask After Filtering Spots by Shape

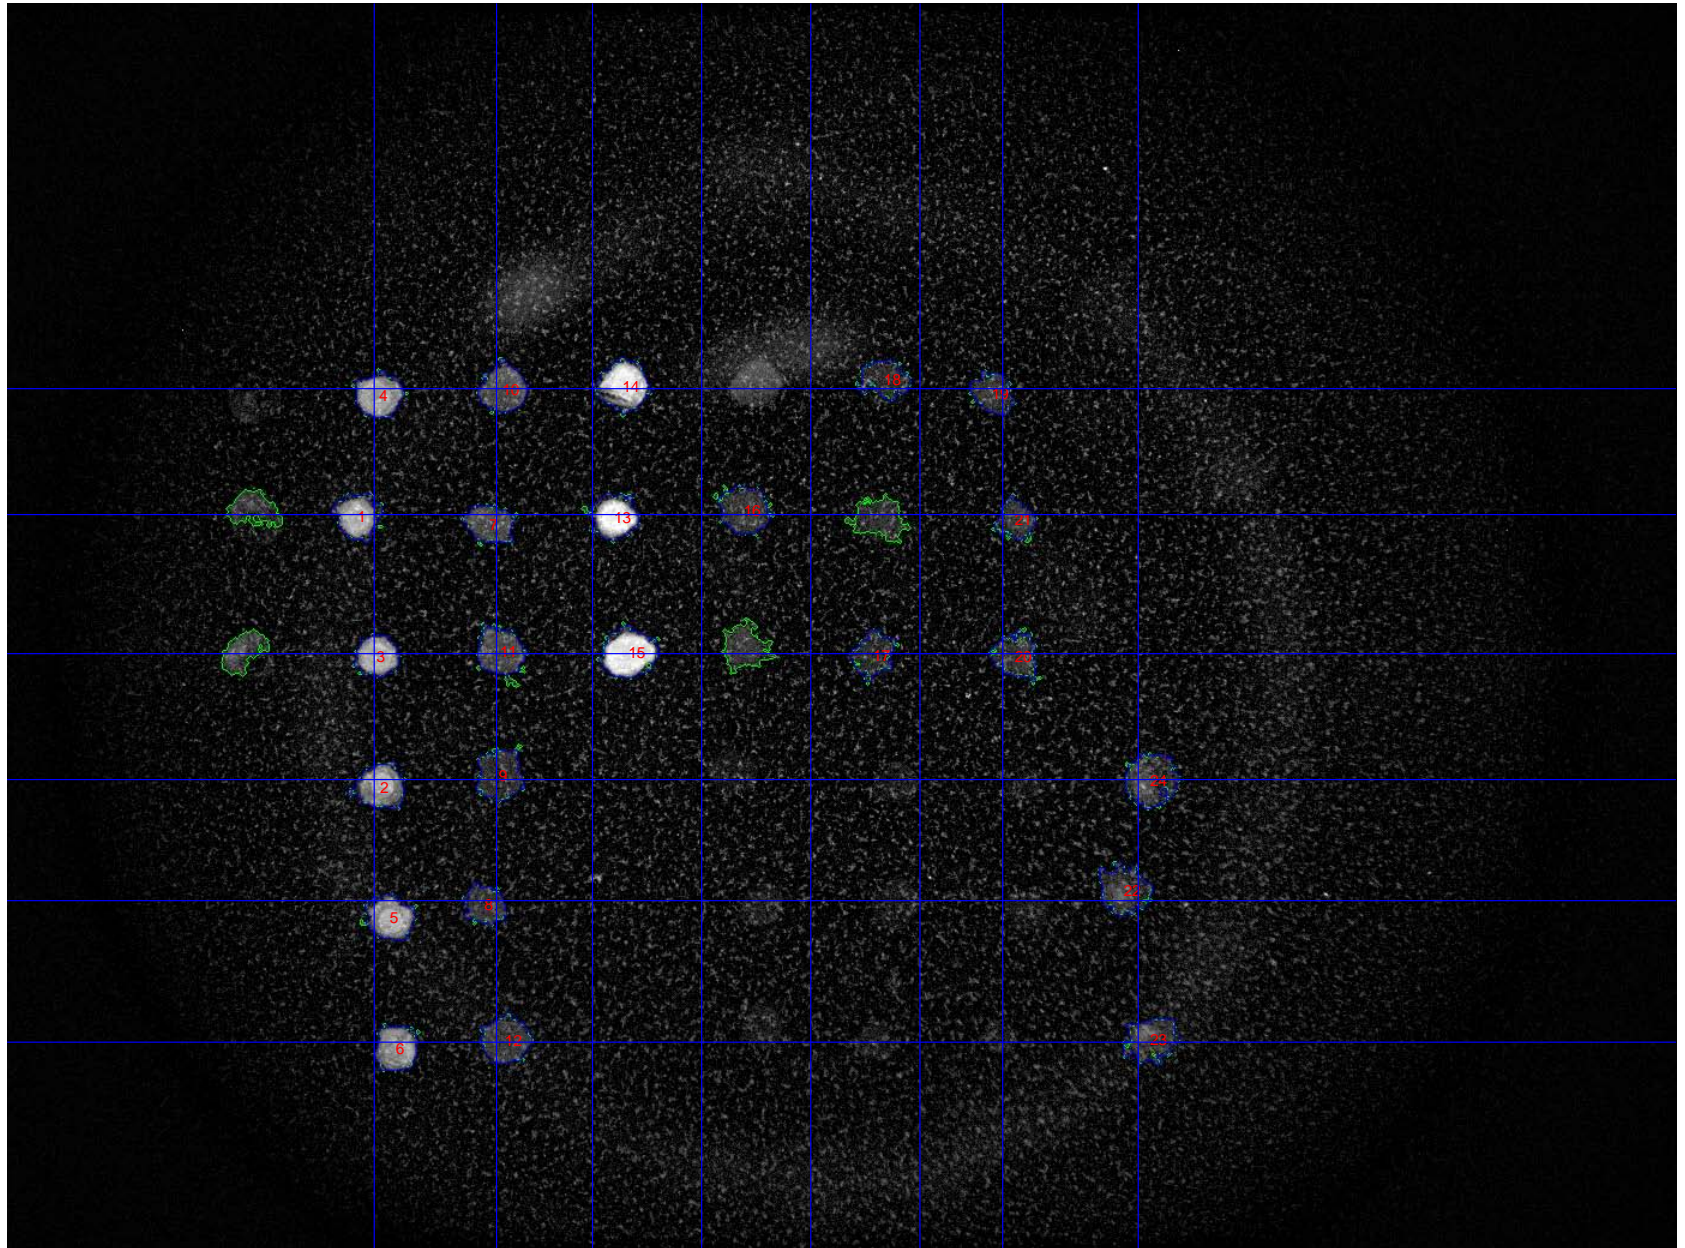

Find Grid from Projections

Horizontal and vertical profiles are processed (erosion, subtraction, reconstruction) to extract peaks and find their centers of gravity as grid positions.

Formation of Grid if Not Enough Spots

Best Pair of Spots to Determine Shifts

Algorithm of finding shifts between the best image and current image:

1. For each spot of the best image find minimal shift distance to spots of the current image
2. Take a few spots giving low distance
3. Choose among them the spot with the best quality measure (brightness and roundness)
4. Record shift from this spot

Best image - #1

Image #6

Image #2

All Masks - Voting

80% of present masks
must coincide

Mask Voting 1: Spot Not Detected

Mask Voting 2: Spot Overestimated

Mask Voting 3: Spot Estimated Correctly

Mask Voting 4: Result

2 masks - correct,
7 masks - overestimated,
6 masks - not found

80% of present masks
must coincide

Measurement Masks: Spots & Rings

Summary of Spot Finding

Shifts

(between best image and each image)

Best Image

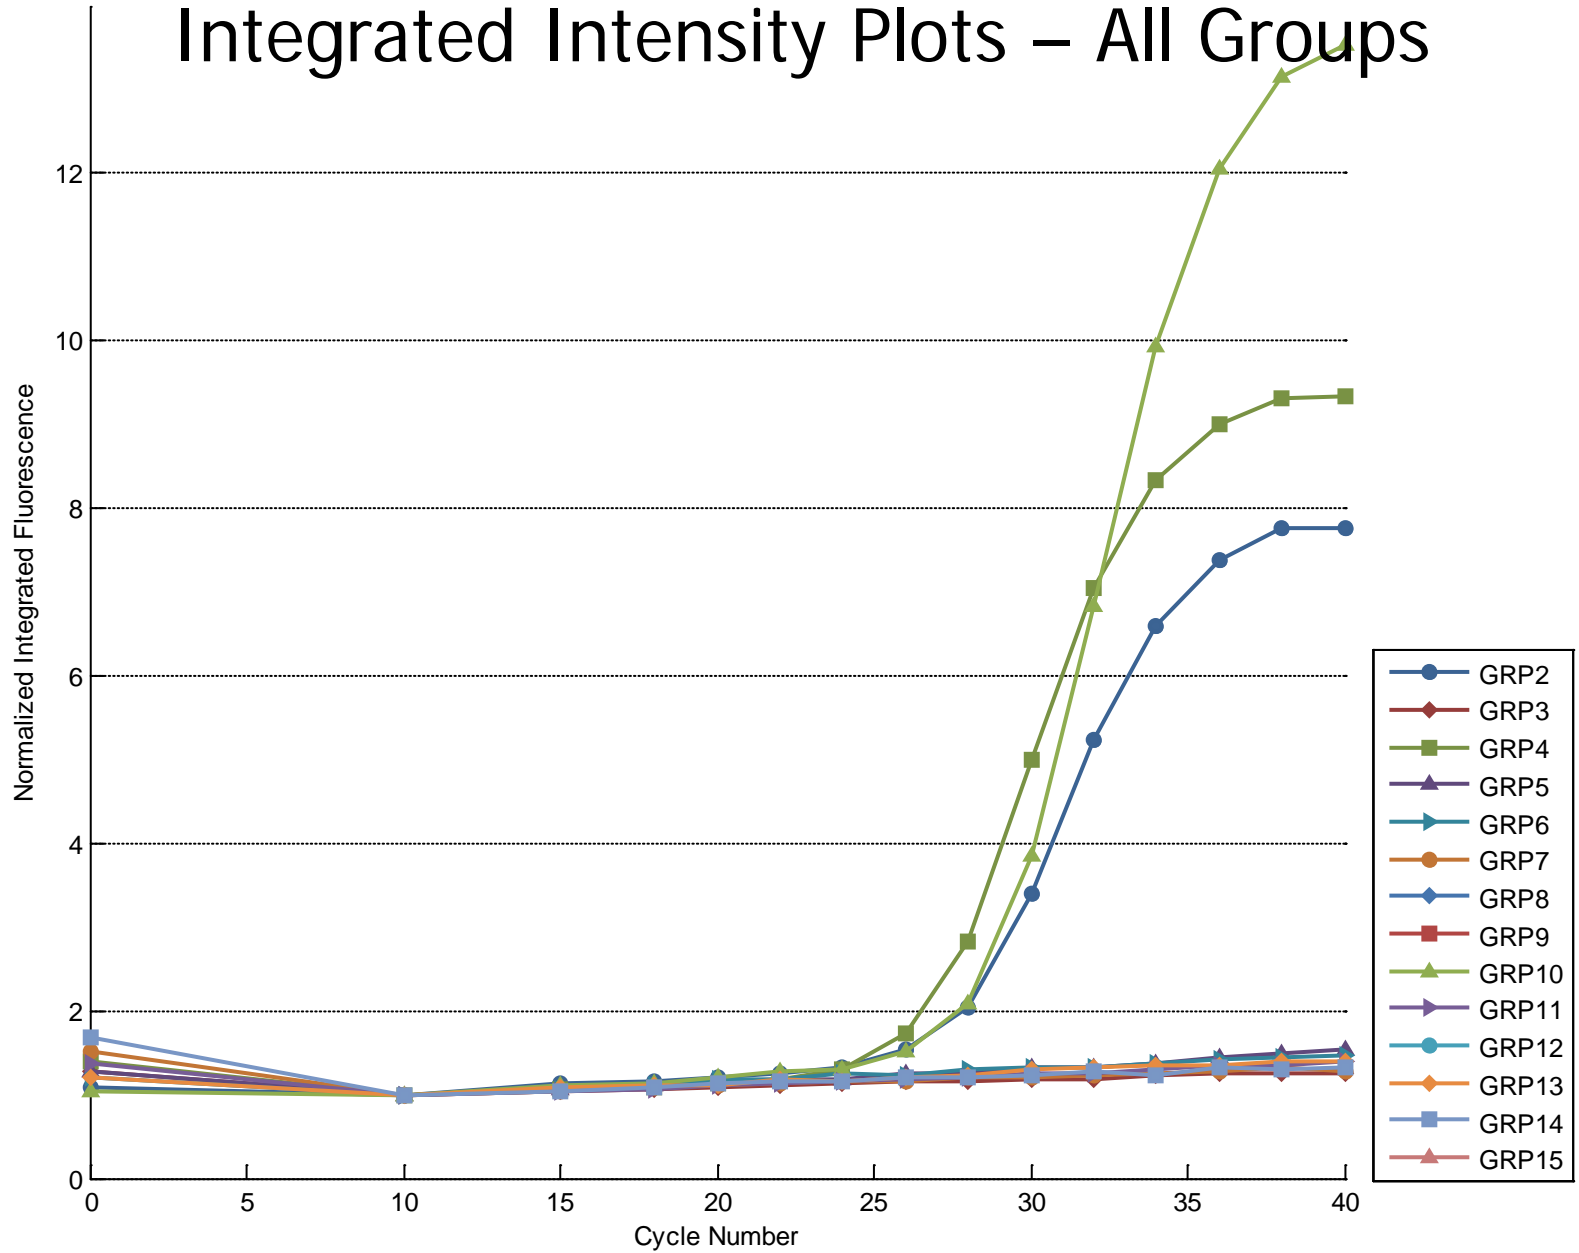

Y-shift	X-shift	Spot Y	Spot X
0	0	382	306
-23	-1	717	1046
-26	-2	376	720
-28	-2	717	1046
-30	-3	382	306
-32	-3	378	954
-31	-5	717	1046
-34	-4	382	306
-34	-5	382	306
-35	-7	382	306
-36	-7	382	306
-36	-8	382	306
-36	-8	717	1046
-38	-7	476	314

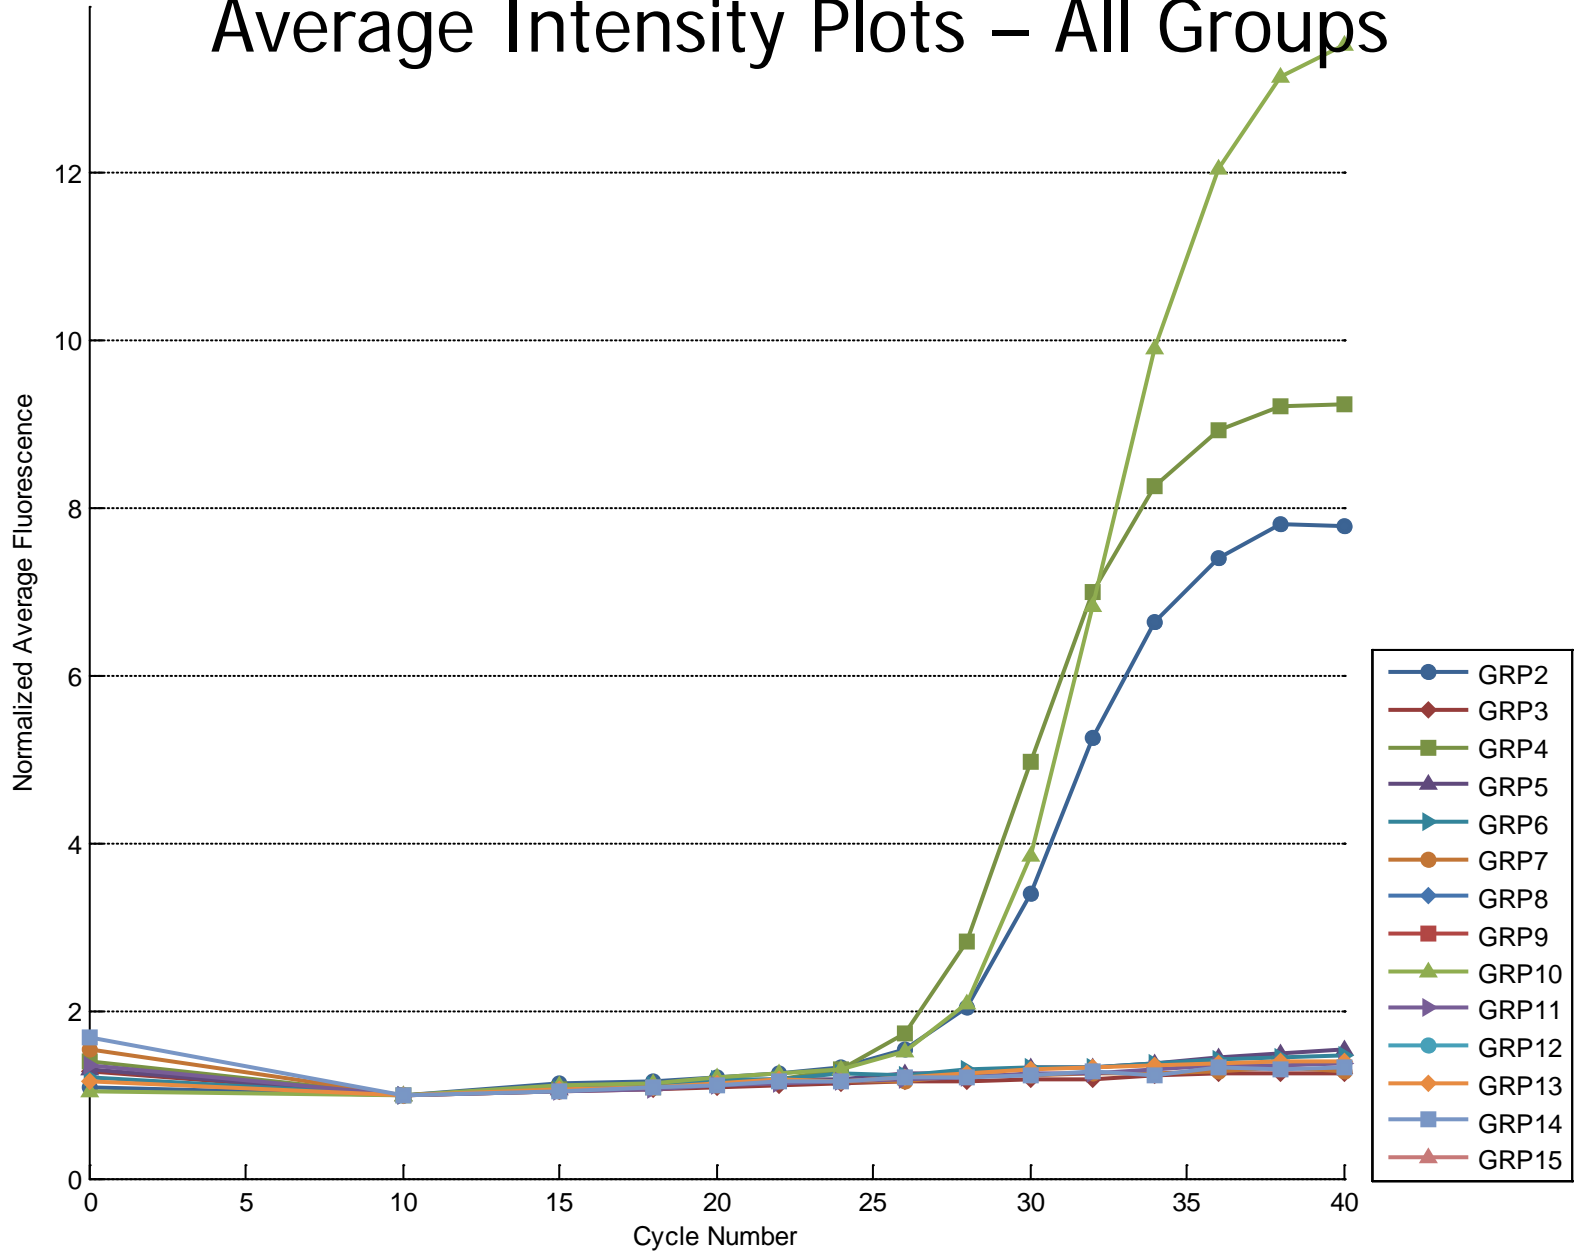

Histograms of background (blue) and spots (green). X-scale from 0 to 1258 (0.999 quantile)

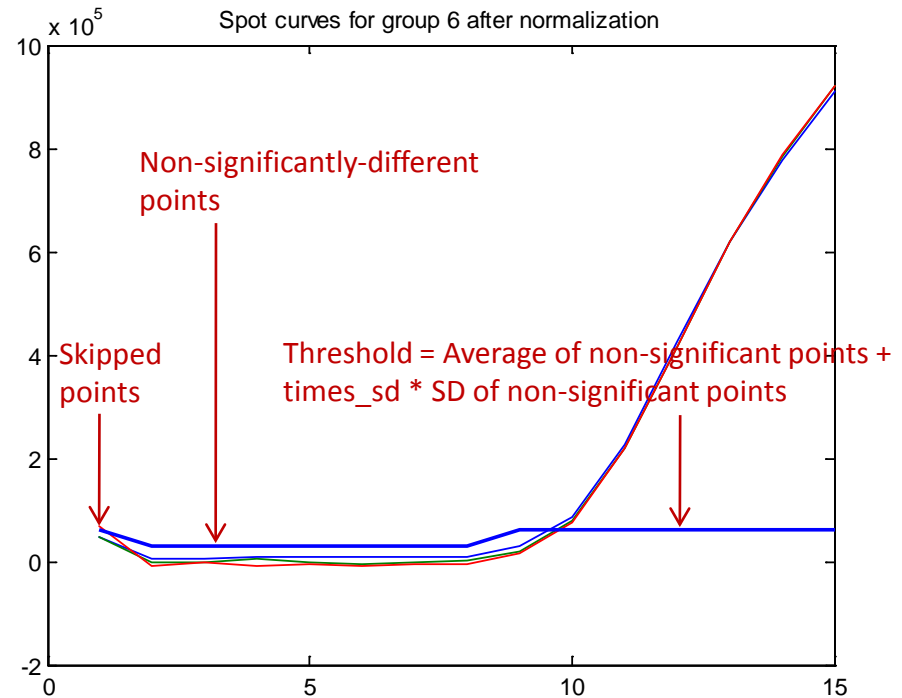

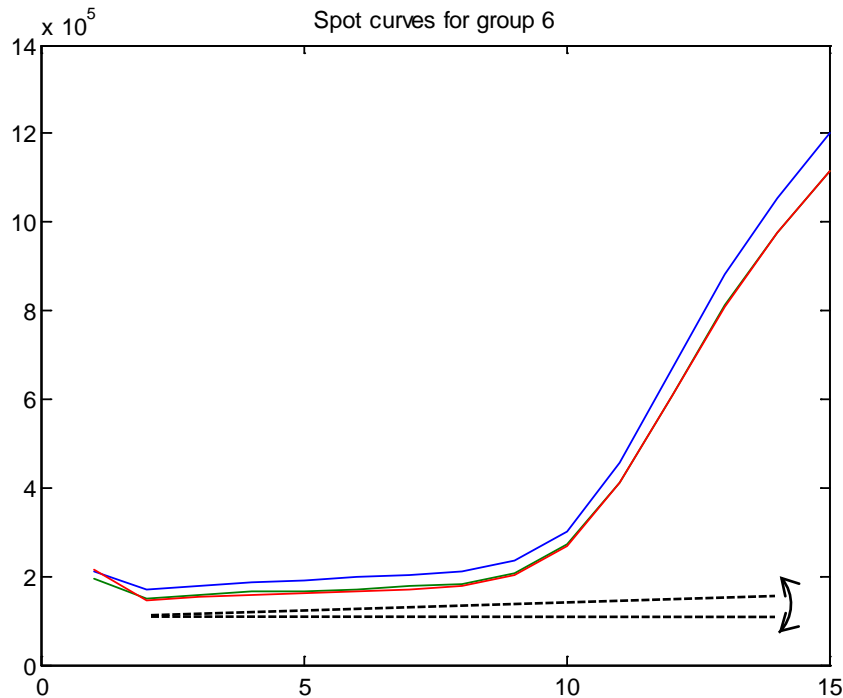

Integrated Intensity Plots – All Groups

Average Intensity Plots – All Groups

Intensity Curve Normalization and Analysis

Curves show different scale for different spots in the same group, probably due to illumination non-uniformity, or spotting variability, or both.

1. Linear regression of curves for spots 2, ... on the curve for spot 1.
2. Normalize to keep the same average.
3. Remove linear trend.
4. Perform 1-D ANOVA of increasing curve fragments until first significant difference among points.
5. Calculate threshold.

Intensity Curve Approximation

Curve fragment around first significant point for group 2 and approximation

Cycle Threshold found by solving equation with the polynomial

Spot curves for group 2 after normalization and average

Approximation of 5-point curve with 4-d degree polynomial

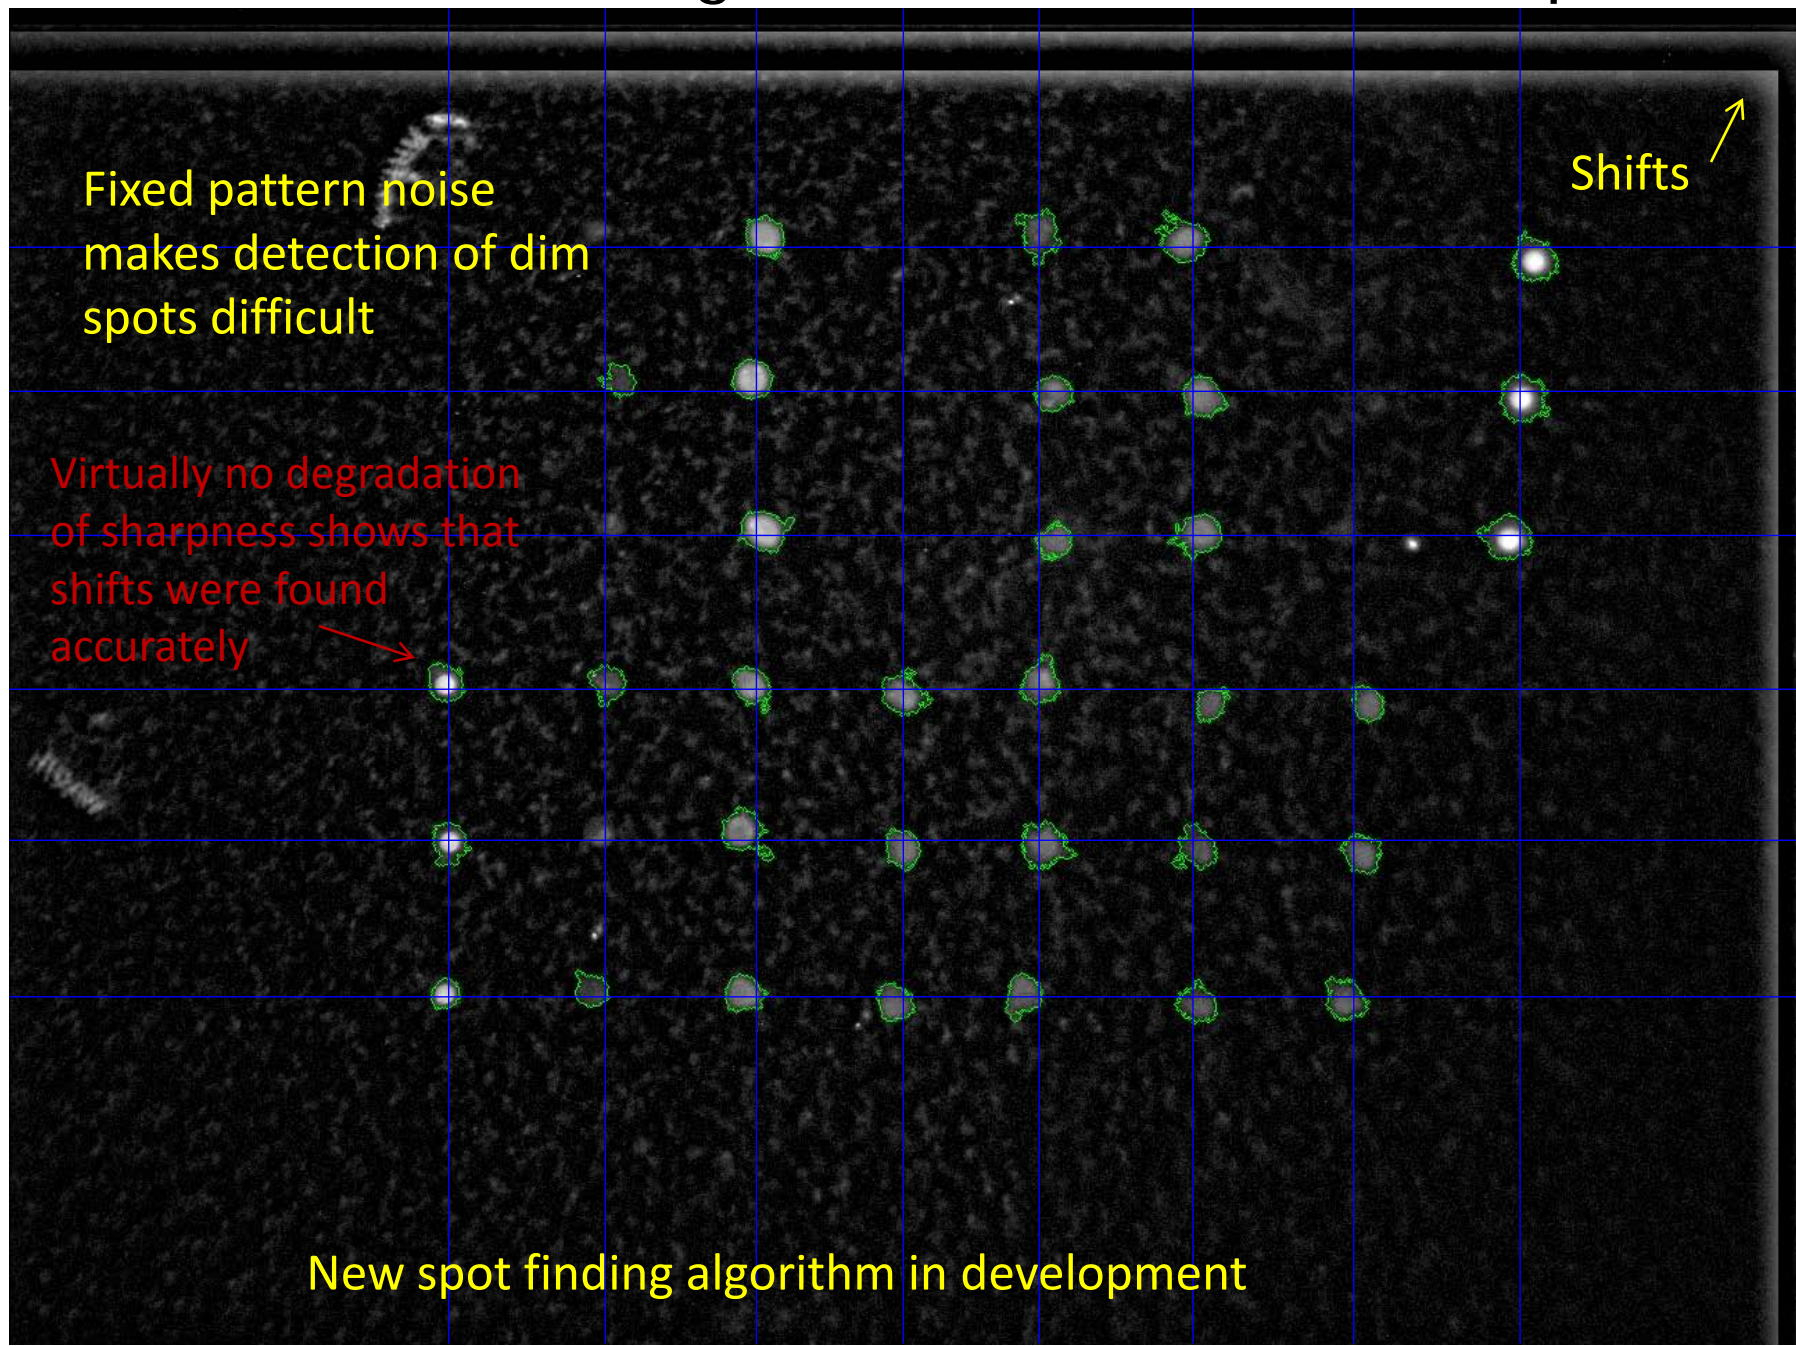

Sequence Threshold

#	GRP	Thresh	BasePts	BaseVal	ThrVal

Accumulated Image with Shifts and Found Spots

Same, After opening

Explanation of Figures in Debug Mode. 1

figs = 1:

i - sequential image number

200 + *i* - Result of finding spots on each image, grids, spot numbers are in order of finding (not by rows and columns)

17 - X-projection for grid finding (all masks with shifts)

18 - Y-projection for grid finding (all masks with shifts)

21 - Addition of all masks with shifts and final mask from voting

22 - Spot and ring masks for measurement

23 - All histograms of background and spots

24 - Best image with final mask, grids, spot numbers by rows and columns (remapped through groups)

25 - Plots of integrated intensity in spots by groups

251 - Plots of integrated intensity in spots by groups (subtraction instead of division)

26 - Plots of average intensity in spots by groups

261 - Plots of average intensity in spots by groups (subtraction instead of division)

27 - Plots of background intensity by groups

28 - Accumulated image with shifts after background removal, contrasting, gamma; spots and spots filtering by grid

29 - Same, with opening (to remove fixed pattern noise)

figs = 2:

1 - Original image

2 - Contrasted image

3 - Background image

4 - Background-removed and contrasted image

5 - Cumulative histogram of background-removed and contrasted image

6 - Thresholded (with quantile) image

7 - Filtered by area

8 - With filled holes

13 - With smoothed edges

14 - With smoothed edges - iteration 2

15 - Spots filtered by shape

19 - Only good spots

300 + *i* - Original image with final mask

Explanation of Figures in Debug Mode. 2

cfigs = 1:

i - sequential image number

$30 + i$ - Spot curves for group i

$50 + i$ - Spot curves for group i after normalization and average

$70 + i$ - Curve fragment around first significant point for group i and polynomial approximation

histfigs = 1:

$90 + i$ - Histograms of background and spots
